## **Introduction: Supervised Learning & Learning Tasks**

[compstat-lmu.github.io/lecture\\_i2ml](https://compstat-lmu.github.io/lecture_i2ml)

# IDEA OF SUPERVISED LEARNING

- **Goal:** Identify the fundamental functional relation in the data that maps an object's features to the target.
- Ideally, we would have full knowledge about the data-generating process and thus be able to specify this mapping function precisely.
- However, since this is basically impossible, we must try to **learn** the mapping function: for objects exhibiting certain patterns or properties, certain outcomes are much more likely.  
→ We call such an assumed mapping a **model**  $f$ .

# IDEA OF SUPERVISED LEARNING

- **Supervised** learning means we make use of *labeled* data, i.e., observations for which we already know the target outcome.
- We try to construct  $f$  automatically from an example set of such labeled objects.  
→ The algorithm for finding  $f$  is called **learner**.
- Using the thus learned model, we can make **predictions** based on the features of our data.
- Knowing the “truth” allows us to test how well we have grasped the nature of the underlying mapping: we just need to compare our predictions to the actually observed values.

# IDEA OF SUPERVISED LEARNING

- Ultimately, we will use our model to compute predictions for **new** data whose target values are unknown.

# TASKS IN SUPERVISED LEARNING

- In general, supervised learning comes in two flavors we call **tasks**:
  - **Regression**: Given features  $\mathbf{x}$ , predict corresponding output from  $\mathcal{Y} \in \mathbb{R}^m$ .

- **Classification**: Assign an observation with features  $\mathbf{x}$  to one class of a finite set of classes  $\mathcal{Y} = \{C_1, \dots, C_g\}$ ,  $g \geq 2$  (details later).

# REGRESSION TASKS: EXAMPLE

Imagine you want to investigate how salary and workplace conditions (*features*) affect productivity of employees (*target*) – a standard **regression** task. Therefore, you collect data about their worked minutes per week (productivity), how many people work in the same office as the employees in question, and the employees' salary.

| Features $x$                          |                             | Target $y$                               |
|---------------------------------------|-----------------------------|--|
| People in Office<br>(Feature 1) $x_1$ | Salary<br>(Feature 2) $x_2$ | Worked Minutes Week<br>(Target Variable) |
| 4                                     | 4300 €                      | 2220                                     |
| 12                                    | 2700 €                      | 1800                                     |
| 5                                     | 3100 €                      | 1920                                     |

$p = 2$

$x_1^{(2)}$

$n = 3$

$x_2^{(1)}$

$y^{(3)}$

# REGRESSION TASKS: EXAMPLE

- For our observed data we know which outcome is produced.
- For new employees can only observe the features but not the target.

# MORE REGRESSION TASKS

## 1 House Prices

**Aim:** Predict the price for a house in a certain area

| Features $x$                |                    |                        |     | Target $y$          |
|-----------------------------|--------------------|------------------------|-----|---------------------|
| square footage of the house | number of bedrooms | swimming pool (yes/no) | ... | house price in US\$ |
| 1,180                       | 3                  | 0                      | ... | 221,900             |
| 2,570                       | 3                  | 1                      | ... | 538,000             |
| 770                         | 2                  | 0                      | ... | 180,000             |
| 1,960                       | 4                  | 1                      | ... | 604,000             |

# MORE REGRESSION TASKS

## ② Length-of-stay in a hospital

**Aim:** Predict the number of days a single patient has to stay in hospital at the time of admission

| Features $x$       |                |        |     |     | Target $y$                             |
|--------------------|----------------|--------|-----|-----|--|
| diagnosis category | admission type | gender | age | ... | Length-of-stay in the hospital in days |
| heart disease      | elective       | male   | 75  | ... | 4.6                                    |
| injury             | emergency      | male   | 22  | ... | 2.6                                    |
| psychosis          | newborn        | female | 0   | ... | 8                                      |
| pneumonia          | urgent         | female | 67  | ... | 5.5                                    |

# CLASSIFICATION TASKS: EXAMPLE

## Risk category in life insurance

**Aim:** Predict one of five risk categories (**classification**) for a life insurance customer to determine the insurance premium

| Features $x$        |     |        |     | Target $y$ |
|---------------------|-----|--------|-----|------------|
| job type            | age | smoker | ... | risk group |
| carpenter           | 34  | 1      | ... | 3          |
| stuntman            | 25  | 0      | ... | 5          |
| student             | 23  | 0      | ... | 1          |
| white-collar worker | 39  | 0      | ... | 2          |
